ActualtestsIT

Try PDF Demo before you buy

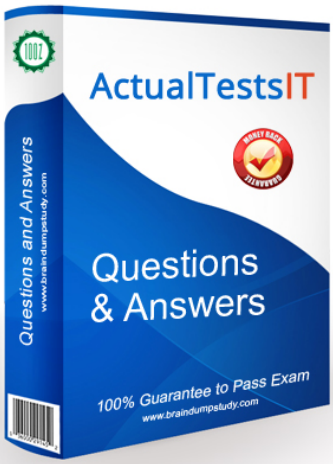
Online Test Engine: Online Tool, Convenient, easy to study. Instant Online Access. Supports All Web Browsers.
PDF format: Easy to read and print learning materials, our products are available in PDF file format.
Desktop Test Engine: Installable Software Application. Simulates Real Exam Environment. Practice Offline Anytime.

Instant Download

After Payment, our system will send you the products you purchase in mailbox in a minute after payment. If not received within 2 hours, please contact us.

365 Days Free Updates

Free update is available within 365 days after your purchase. After 365 days, you will get 50% discounts for updating.



Money Back Guarantee

Full refund if you fail the corresponding exam in 60 days after purchasing. And Free get any another product.

Security & Privacy

We respect customer privacy. We use McAfee's security service to provide you with utmost security for your personal information & peace of mind.

Exam : **1z0-1111-23**

Title : Oracle Cloud Infrastructure 2023 Observability Professional

Vendor : Oracle

Version : DEMO

NO.1 You are part of an organization with thousands of users accessing Oracle Cloud Infra-structure (OCI). An unknown user action was executed resulting in configuration errors. You are tasked to quickly identify the details of all users who were active in the last six hours along with any REST API calls that were executed.
Which OCI service would you use?
A. Logging
B. Audit
C. Management Agent
D. Notifications
E. Service Connectors
Answer: B
Explanation
To identify the details of all users who were active in the last six hours along with any REST API calls that were executed, you can use OCI Audit service. Audit service is a service that records all the API operations performed on your OCI resources. Audit service provides security, compliance, and governance information about your OCI resources. You can use Audit service to view and search audit events based on various criteria, such as user name, resource type, or time range.

NO.2 Which TWO functions does the Trace Explorer allowyou to do in Application Performance Monitoring (APM)? (Choose two.)
A. View the details of specific spans
B. Select pre-defined queries for common use cases
C. Display status of monitored systems
D. Define custom metrics for traces
Answer: A B
Explanation
Two functions that the Trace Explorer allows you to do in APM are:
* View the details of specific spans. Trace Explorer is a tool that lets you view and analyze the traces and spans collected by APM. You can use Trace Explorer to drill down into the details of specific spans, such as duration, status, tags, logs, and errors.
* Select pre-defined queries for common use cases. Trace Explorer also provides a set of pre-defined queries that can help you find traces and spans based on common use cases, such as slowest traces, error traces, or traces by service name.

NO.3 Which is the recommended method to continuously monitor and ingest logs from Object Storage buckets?
A. Object Store
B. Object Store Bucket
C. Object Collection Rule
D. Object Storage
Answer: C
Explanation
The recommended method to continuously monitor and ingest logs from Object Storage buckets is ObjectCollection Rule. ObjectCollection Rule is a feature of Logging Analytics that allows you to

collect log data from objects stored in Object Storage buckets. You can create an ObjectCollection Rule that specifies the bucket name, object name pattern, entity type, and log source for your log data.

NO.4 Which are the different data sources from where the Application Performance Monitoring (APM) Java agent can collect spans and metrics data?

A. Jaeger or Zipkin

B. VMware ESXi

C. WebLogic, Tomcat, or JBoss

D. NginX

Answer: A

Explanation

The data sources from where the APM Java agent can collect spans and metrics data are Jaeger or Zipkin.

Jaeger and Zipkin are open source distributed tracing systems that provide end-to-end visibility into complex transactions across multiple services and components. The APM Java agent can collect spans and metrics data from Jaeger or Zipkin compatible applications and send them to APM for analysis and visualization.

NO.5 Which statement is NOT valid about creating an alarm query in Oracle Cloud Infrastructure (OCI) Monitoring?

A. You must specify a metric.

B. You must specify a resource group.

C. You must specify a statistic.

D. You must specify an interval.

Answer: B

Explanation

A valid statement about creating an alarm query in OCI Monitoring is that you must specify a resource group.

A resource group is an optional feature that allows you to group metrics by certain attributes or tags. By specifying a resource group in your alarm query, you can filter out the metrics that belong to different resource groups and focus on the ones that are relevant for your alarm condition.

NO.6 Your on-premises private cloud environment consists of virtual machines hosting a set of application servers.

These VMs are currently monitored using a 3rd party monitoring tool for resource metrics such as CPU and Memory utilization. You have created an automation work-flow to transform these application servers into Oracle Cloud Infrastructure (OCI) which will deploy a set of new compute instances. There are a few requirements to consider while running this task: * Ensure continuous monitoring is enabled, so the current monitored resource metrics are continuously collected and reported. * Monitor the completion of Compute In-stance deployment during the workflow and notify with email on each execution. Notify with email for any new OCI Object Storage buckets created after the migration workflow. What solution would you recommend to achieve these requirements?

A. Configure OCI Compute agent on on-premises VMs to collect required resource met-rics. Use OCI

Events service to track all deployments (com.oraclecloud.computeapi.launchinstance.end) with OCI Notifications service to track and report all changes occurring in the target environment.

B. Configure OCI Compute agent on OCI compute instances to collect required resource metrics. Use OCI Events and Functions services to track the Instance deployment (com.oraclecloud.computeapi.launchinstance.end) and creation of new buckets (com.oraclecloud.objectstorage.createbucket). Use OCI Notifications and Events service to notify these changes.

C. Configure OCI Compute agent on on-premises VMs and OCI compute instances to collect required resource metrics. Use OCI Events service to track the end-to-end deployment process (com.oraclecloud.compute api.launchinstance.end) and creation of new bucket (com.oraclecloud.objectstorage.createbucket). Use OCI Notifications and Events services to notify these changes.

D. Configure both 3rd party monitoring tool and OCI Compute Agent on OCI compute instances to collect required resource metrics. Use OCI Events service (com.oraclecloud.computeapi.launchinstance.end) with Notifications service to track and notify all changes occurring in the target OCI environment.

Answer: C

Explanation

To ensure continuous monitoring of both on-premises VMs and OCI compute instances, you need to configure OCI Compute agent on both sources to collect the required resource metrics. The OCI Compute agent is a lightweight process that monitors the host and the processes running on the host. You can use OCI Events service to track the end-to-end deployment process (com.oraclecloud.computeapi.launchinstance.end) and creation of new buckets (com.oraclecloud.objectstorage.createbucket) in your target environment. You can use OCI Notifications and Events services to notify these changes via email or other supported protocols.

NO.7 Which response contains rich information to process for analytics?

A. Entity types

B. Logging Analytic Entities

C. Database Audit Logs

D. Log Sources

Answer: C

Explanation

Database Audit Logs contain rich information to process for analytics, such as user actions, database operations, and security events. Logging Analytics can ingest and analyze these logs to provide insights into the health and performance of your databases.
